

# AccessAlert

## Industry First Safety Enhancement

The AccessAlert alarm is a practical and industry-first safety enhancement that can be applied to elevator equipment worldwide.

### Safety should be automatic

Similar to the seatbelt alarm found in your car, an alarm sounds when anyone enters the hoistway. The alarm continues to sound until it is physically switched off.

The alarm also sounds when the car is placed in inspection mode. To silence the alarm, the technician must push the silence button at the same time as the inspection station button. This places the technician in a safe position during the movement.

The alarm is meant to be heard only in the hoistway, so it won't disrupt the rest of the building's occupants.

### Any elevator, anywhere

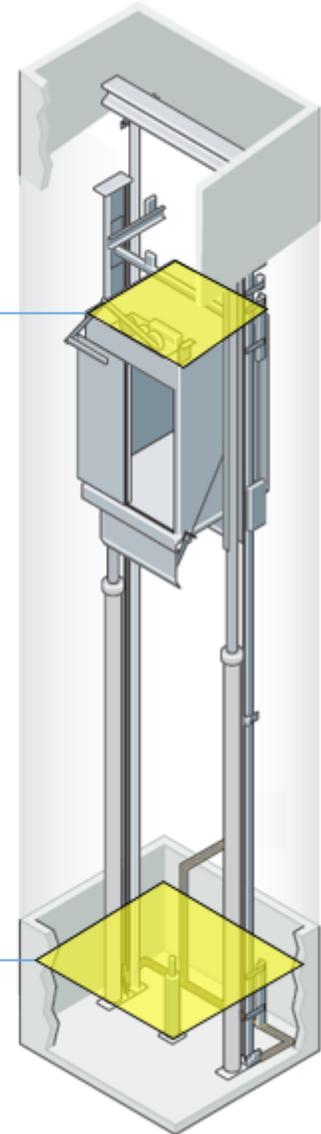

The AccessAlert system can be implemented on any elevator, including non-Otis products, and meets current elevator safety codes.
